

The SCF utilizes Set Theory Relationship Mapping (STRM) based on **NIST IR 8477**, since this methodology is well-suited for mapping disparate cybersecurity and data protection-specific laws, regulations and/or frameworks.

While STRM supports several options for rationale (e.g., Syntactic, Semantic and Functional), the SCF only utilizes Functional rationale. The reason for this selection is clear, since Functional rationale focuses on evaluating the equivalency of results (e.g., how similar are the results of executing the two concepts?). Functional rationale involves understanding what will happen if the two concepts are implemented, performed, or otherwise executed.

There are two sides required to perform STRM:

- (1) Reference Documents; and
- (2) Focal Documents.

In the SCF's use of STRM, the SCF is always the Reference Document, where SCF controls are considered the Reference Document Element (RDE). The law, regulation or framework being mapped to is the Focal Document, where its discrete components are considered Focal Document Elements (FDEs). STRM indicates the relationships between a FDE and a RDE by:

- (1) Qualifying the rationale for indicating the connection between discrete elements; and
- (2) Classifying the relationship utilizing set theory principles (e.g., Subset Of, Intersects With, Equal, Superset Of, or No Relationship).

The mapping from SCF controls to FDEs provides the granularity necessary for defensibility purposes.

Set Theory Relationship Mapping (STRM) Examples

SCF

Reference Document

Law,
Regulation or
Framework

Focal Document

Relationship Type: **SUBSET OF**

The Focal Document Element (FDE) is a subset of SCF control. (e.g., Reference Document Element). Functionally, the SCF control contains everything that FDE does and more.

Relationship Type: **INTERSECTS WITH**

The SCF control has **contextual overlap** with the FDE, but each includes functionality the other does not have.

Relationship Type: **EQUAL**

The SCF control and FDE are functionally equivalent, although not necessarily identical.
